

# Data Model for Persistent todoMVC

---

By Perfecxus Team

## Model Diagram

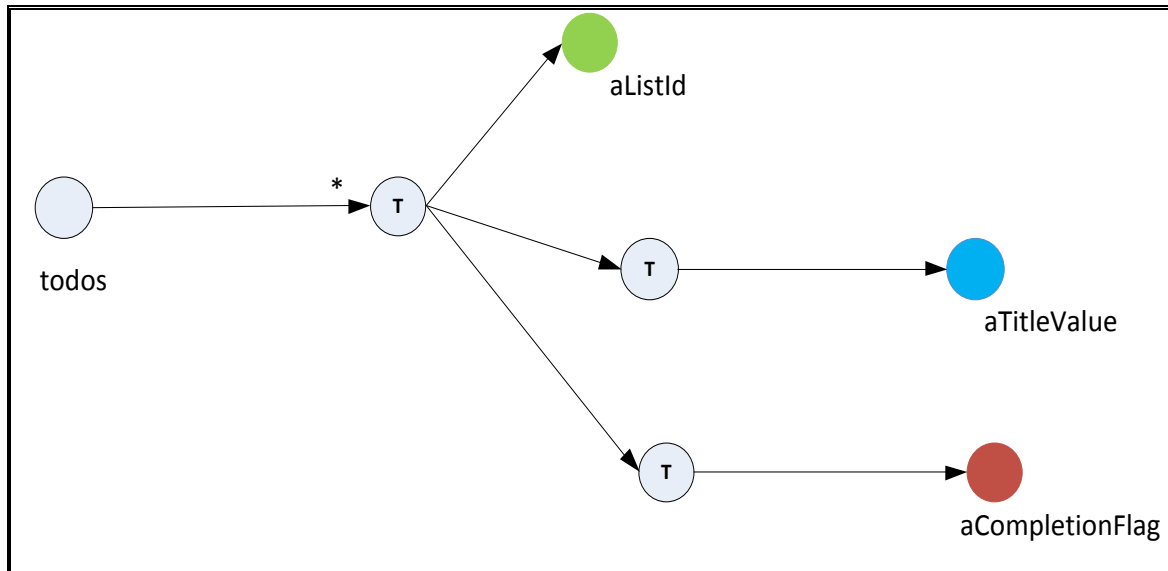

Fig 1: Abstract data model to save to do List

Here, a todo list is saved by the root node todos. The todos is connected to a todo item's id node denoted as the text based reference node which is a of property type "aListId". Each list Id has two values (one of value type "aTitleValue" and another of a value type "aCompletionFlag"). "aTitleValue", "aCompletionFlag" and "aListId" are globally persisted nodes.

The model is developed based on property 3 of Next-Web API as shown below:
